1 micrometer

# Quantum Computation?

## 1. Classical computers can be reversible

n bit computation = permutation on  $2^n$  states

## 2. Quantum computation: replace

bits                      ➡ two level quantum systems

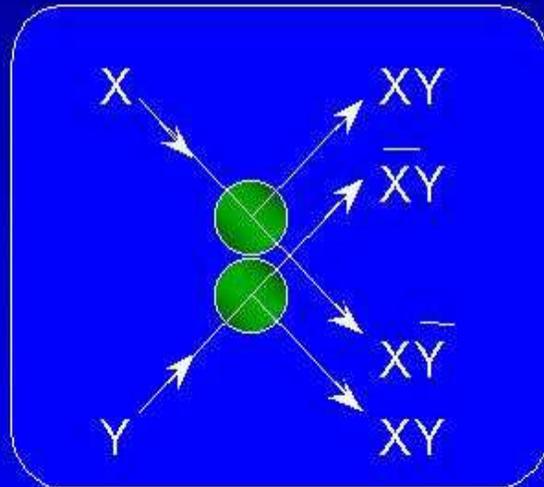

permutations        ➡ unitary transformations

- Facts:
- Quantum computation subsumes classical
  - Certain problems can be solved faster with QC
  - 2, 3, and 5 "qubit" QC's have been experimentally realized

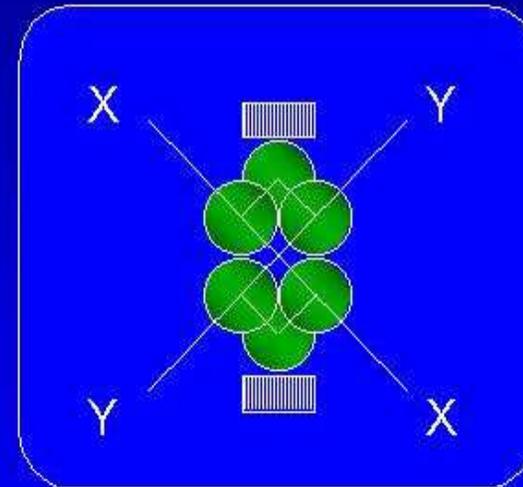

# Computation is Reversible!

(Bennett 1973; Feynman 1982)

Billiard ball collisions may be used to build logic gates

Interaction Gate

Crossover

- Newton's laws are microscopically reversible
- Energy dissipation required *only* for stability

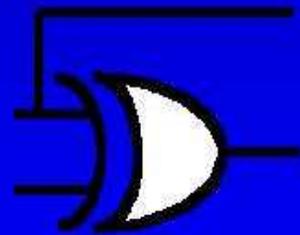

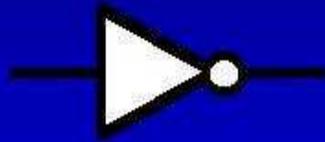

# Classical → Quantum

• States:

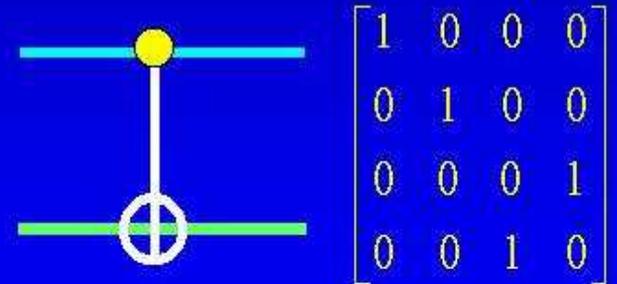

0,1

$|0\rangle, |1\rangle$

• Gates:

In	Out
00	00
01	01
10	11
11	10

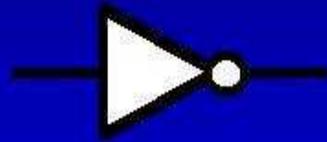

# Classical → Quantum

- States:

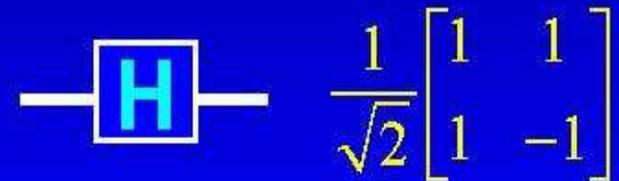

0,1

$|0\rangle, |1\rangle$

- Gates:

- Hadamard:

$$F = ma$$

Newton's laws

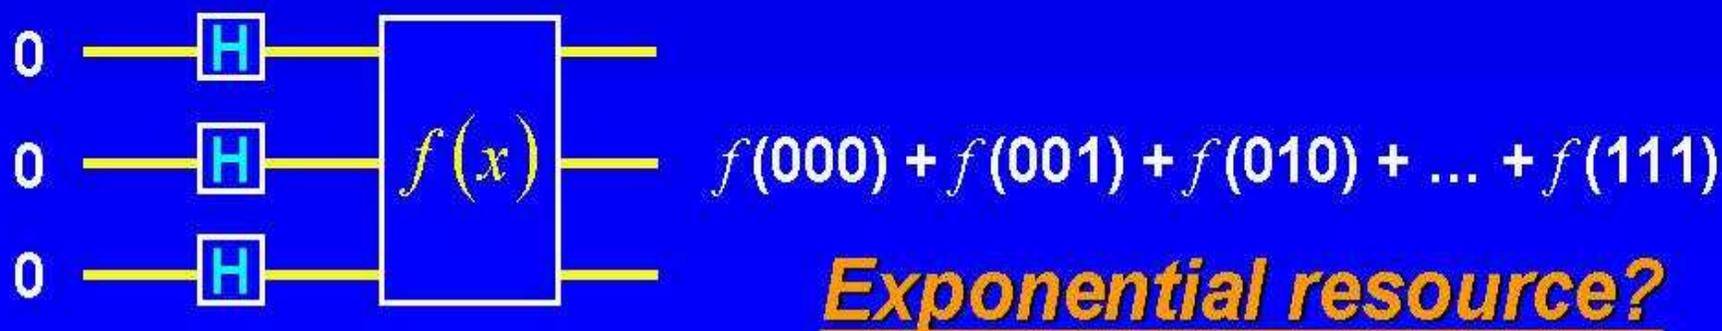

$$i\hbar \frac{d}{dt} |\psi\rangle = H |\psi\rangle$$

Schrodinger's Eq.

# Quantum Parallelism

$$|0\rangle \xrightarrow{\text{H}} \frac{1}{\sqrt{2}}|0\rangle + \frac{1}{\sqrt{2}}|1\rangle$$

$$|00\rangle \xrightarrow{\text{H}} \frac{|00\rangle + |01\rangle + |10\rangle + |11\rangle}{\sqrt{4}}$$

# Quantum Parallelism

$$f(000) + f(001) + f(010) + \dots + f(111) \quad \text{—} \quad \text{Measurement}$$

→  $f(000)$  or  $f(001)$  or  $f(010)$  or ... or  $f(111)$   
each with probability  $1/8$

**Superpositions collapse on measurement.**

# Theoretical Promise

## ULTRAFAST COMPUTATION

(Shor, Grover, 1994-1996)

### *Factoring Integers*

- $N = pq$
- $L$  digits numbers
- Given  $N$ , what is  $p$  and  $q$ ?

$$O(e^{L^{(1/3)}}) \rightarrow O(L^3)$$

10 billion years  
400 digits

3 years

### *Searching Databases*

- Unordered list of  $N$  items
- Find an item: how many queries?

$$O(N) \rightarrow O(\sqrt{N})$$

1 Month

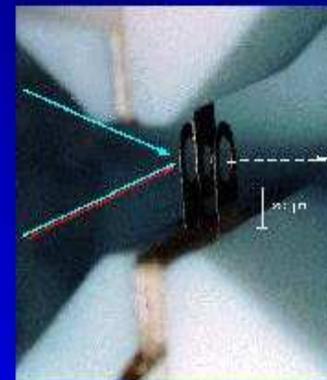

27 minutes

# Experimental Challenge

- Quantum systems typically have short lifetimes
- External control of quantum dynamics is difficult

## Ion Trap

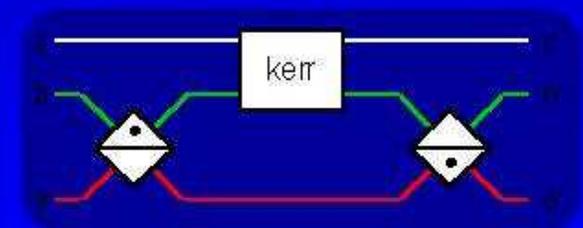

- Single electromagnetically trapped  $\text{Be}^+$  ion cooled to below 1 nano Kelvin

NIST, IBM,  
LANL, Oxford

## Nonlinear Optics

- Single photons incident on a single atom falling through a cavity with 99.999% reflectivity mirrors

Caltech, Ecol.  
Poly., Innsbruck

UCSB,  
Harvard

## Quantum Dots

- Confined electrons in artificial atom

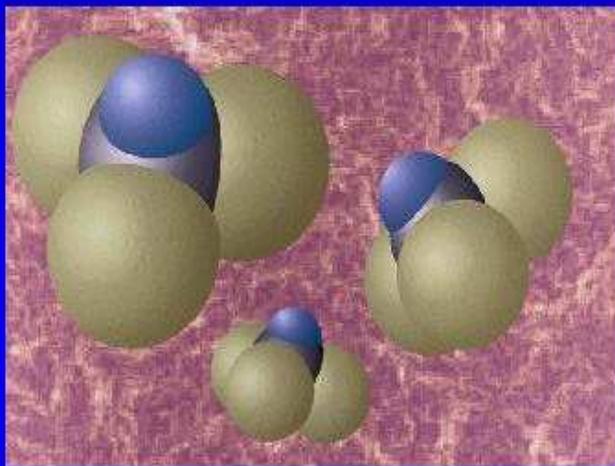

# Bulk Spin-Resonance Quantum Computation

( Gershenfeld and Chuang, Science 275, p.350, 1997  
Cory, Fahmy, and Havel, PNAS 94, p.1634, 1997 )

*Information (qubits) = Nuclear spins*

*Interactions = Chemical bonds*

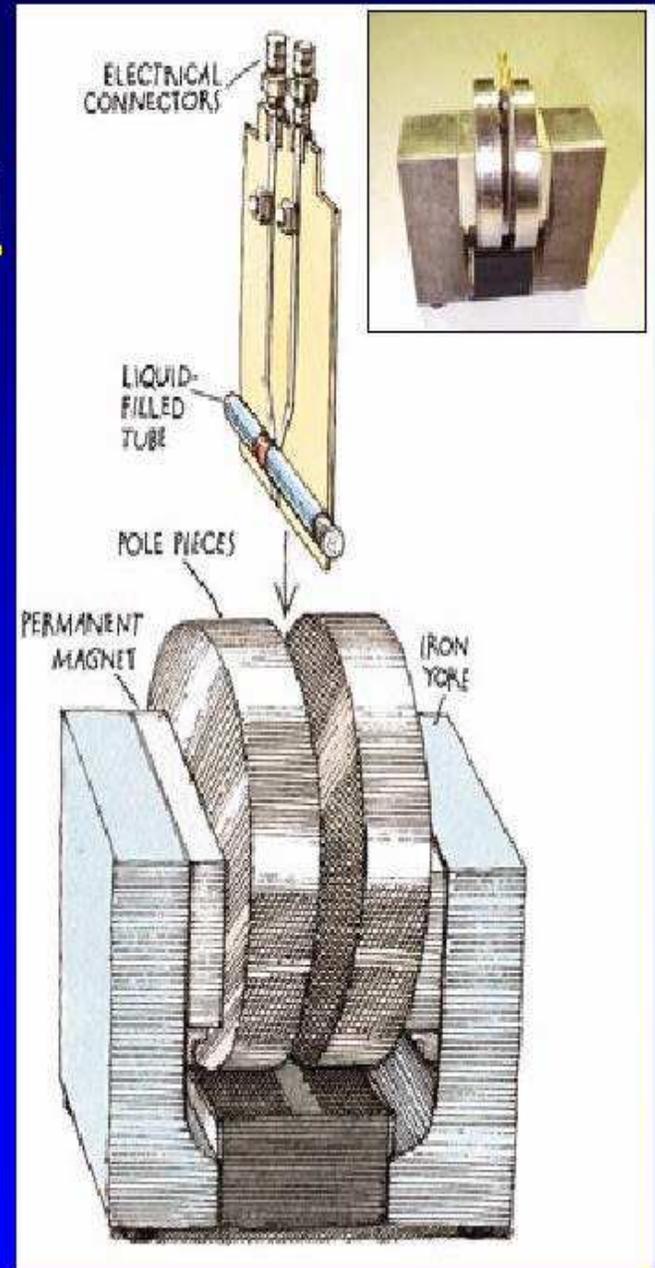

*Circuits = Electromagnetic field pulses*

 e-mail: jchuang@mit.edu

Quantum computers<sup>1,2</sup> can in principle exploit quantum-mechanical effects to perform computations much more rapidly than classical computers<sup>3,4</sup>. The basic idea of quantum computing is that the bits are replaced by qubits, which are represented by the states of a quantum system. The qubits are coupled to each other and their collective state evolves according to the Schrödinger equation. The quantum algorithm has been implemented with these systems. Here we

# First Implementation: Quantum Algorithm

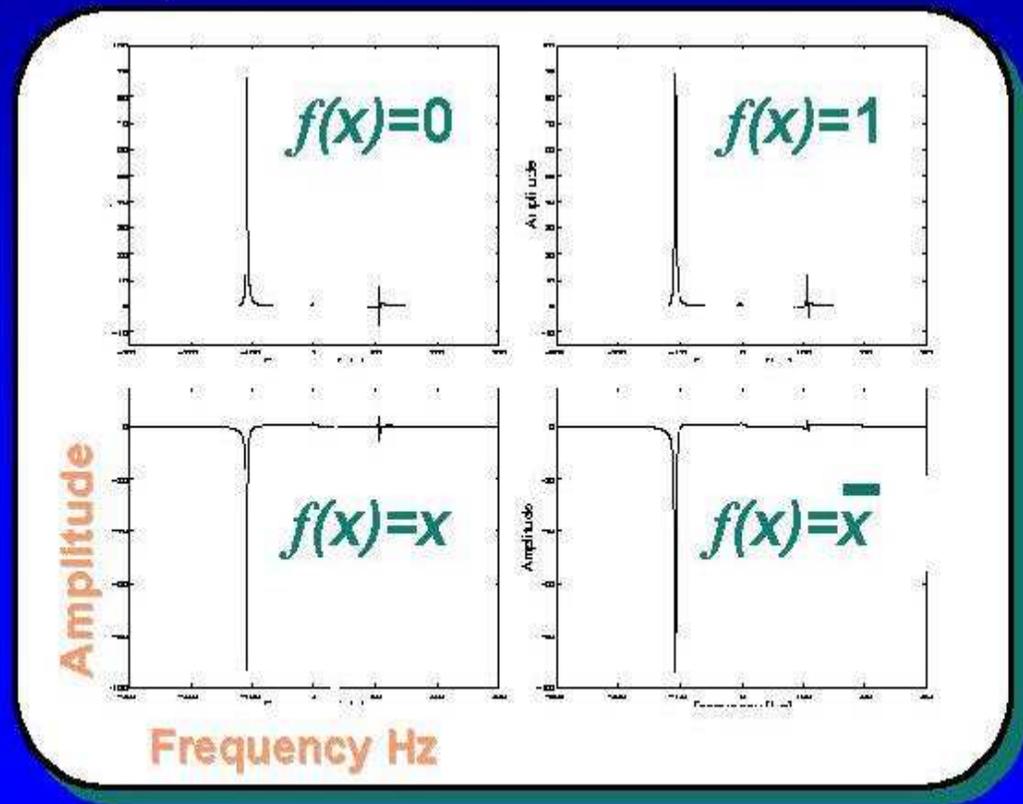

( Chuang, Vandersypen, Zhou, Leung, and Lloyd, Nature, May 14, 1998 )

- Given  $f(x)$ : Calculate  $f(0) + f(1)$  (ONE function evaluation)

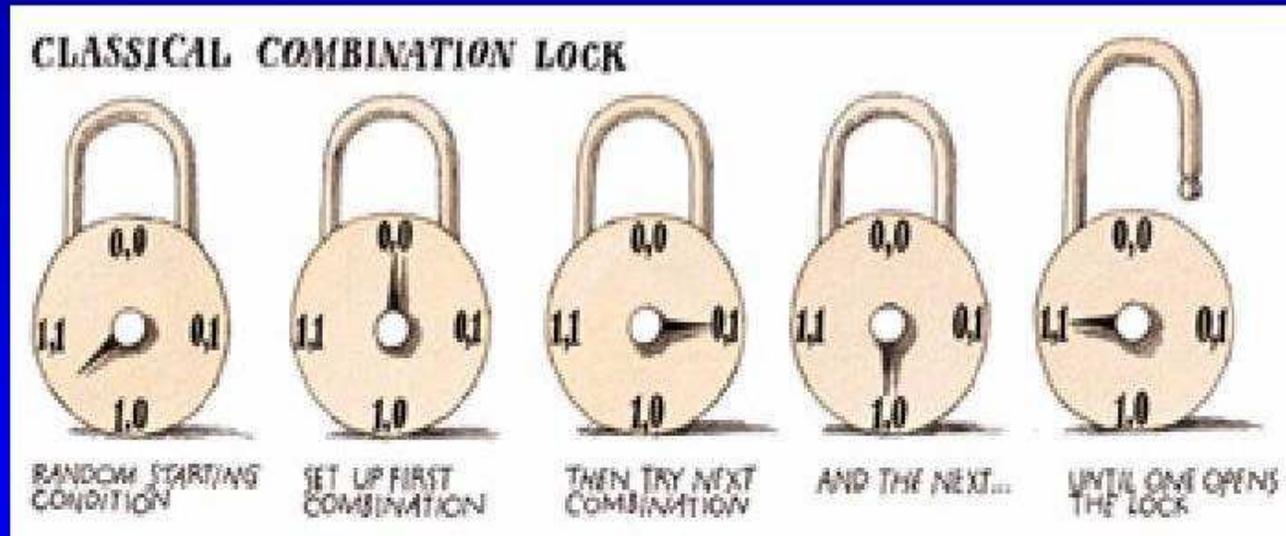

$f(0) + f(1) = 1$

$f(0) + f(1) = 0$

# Demonstration of Fast Quantum Search

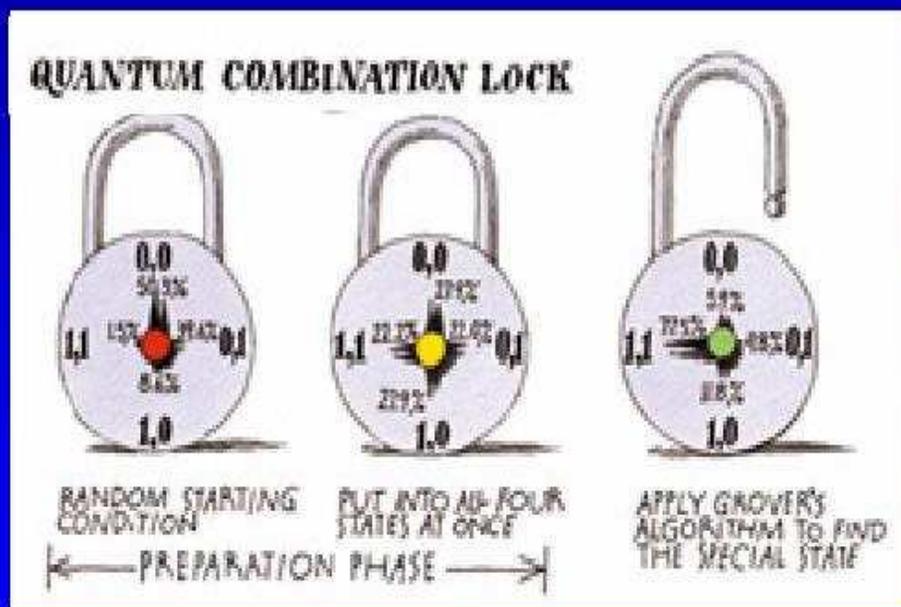

( Grover, 28th ACM Symposium on Theory of Computation, 1996 )

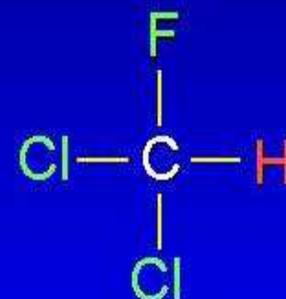

**Classical search: # trials =  $\frac{1+2+3+3}{4} = 2.25$**

# Demonstration of Fast Quantum Search

( Chuang, Gershenfeld, and Kubinec, PRL 80 p. 3408, 1998; Jones, Mosca, and Hansen, Nature 393, p. 344, 1998; Vandersypen, et. Al., APL 76, p646, Jan. 2000 )

2 qubits

3 qubits

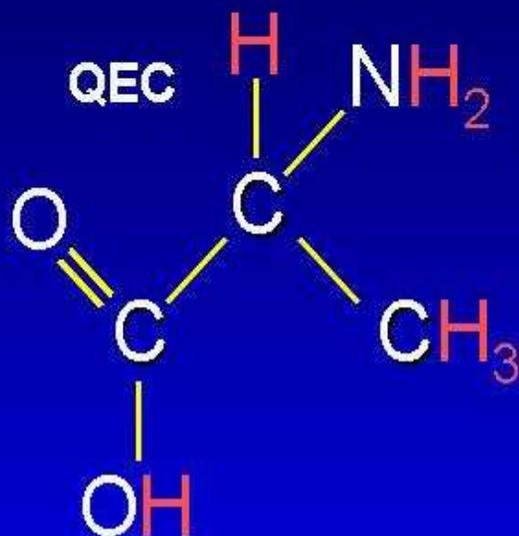

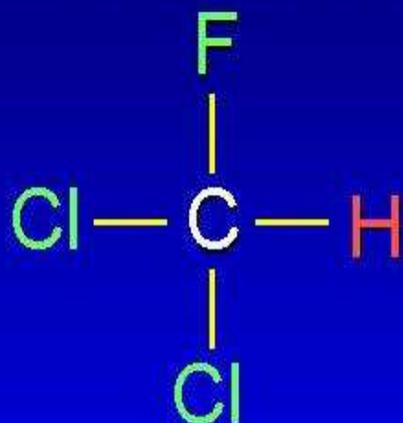

• ~250 Q. logic gates!

Quantum search: ONE trial

$$O(N) \rightarrow O(\sqrt{N})$$

# NMRQC Molecules

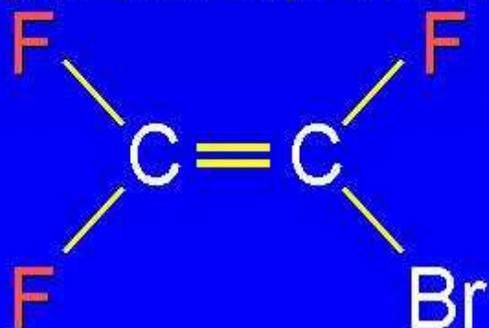

Fast Grover Search

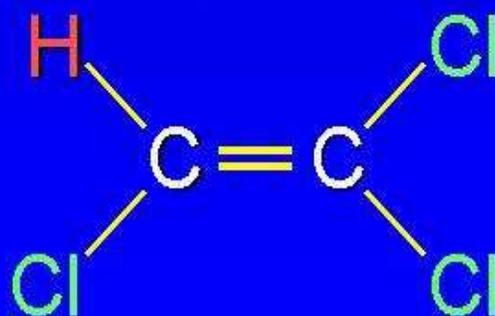

Simple H.O.

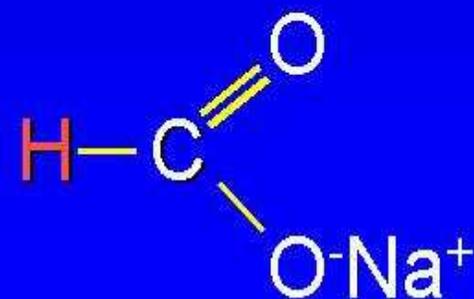

Logical labeling / Grover

Teleportation

Q. Error Correction

# A 5-qubit Problem

- Given a permutation  $\pi(y)$  :

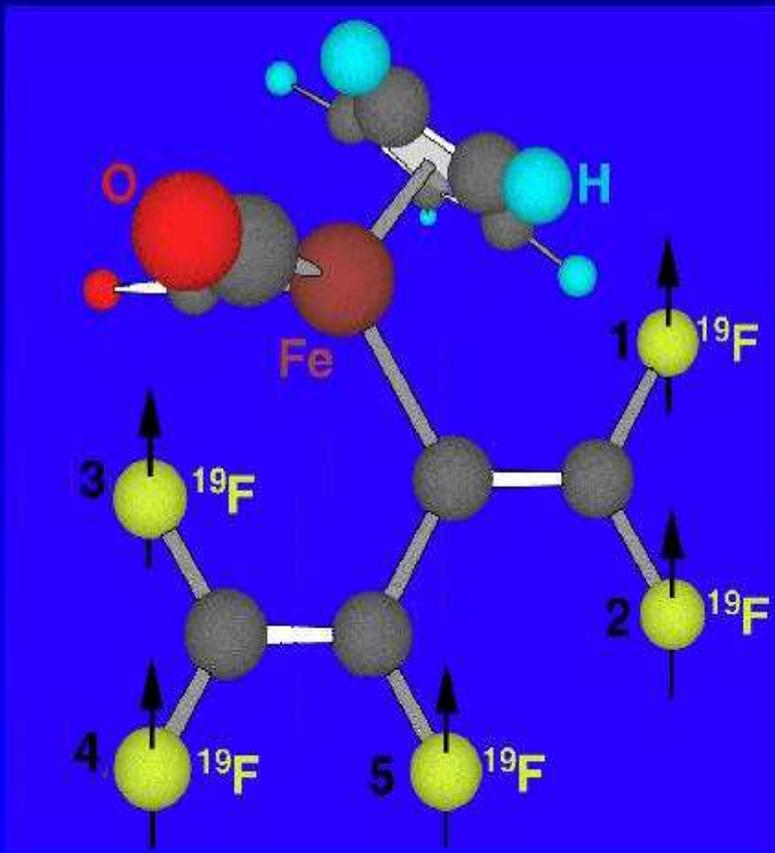

Calculate  $r$  such that  $\pi^r(y) = y$

- This problem is *hard*! If  $y \in \{0,1\}^n$   
then  $O(2^n)$  trials are required, classically.

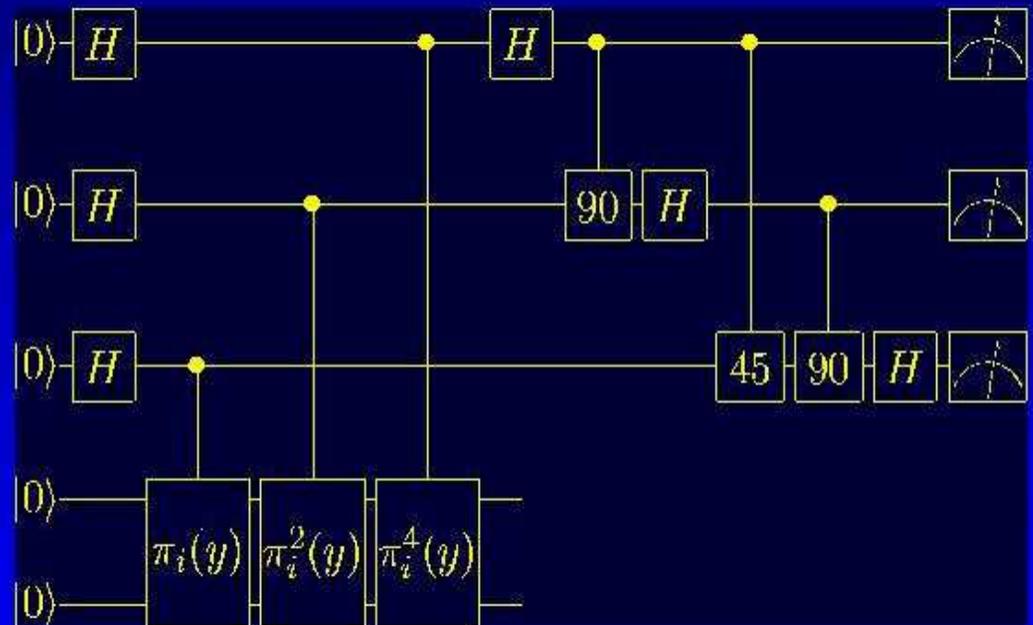

- Quantum:  $O(n)$  trials

# 5 qubit 215 Hz Q. Processor

( Vandersypen, Steffen, Breyta Yannoni, Cleve, and Chuang, 2000 )

• The Molecule

• Quantum Circuit

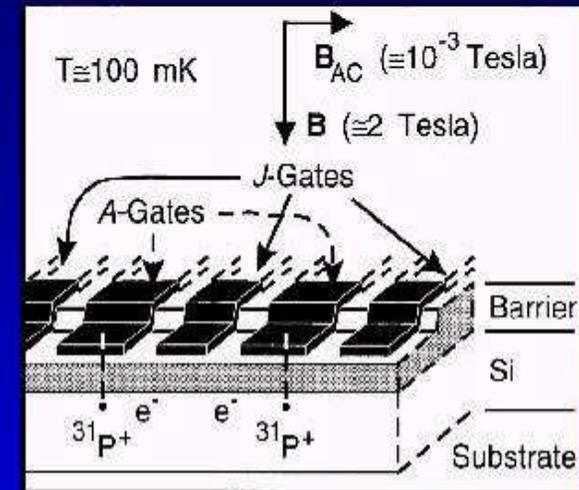

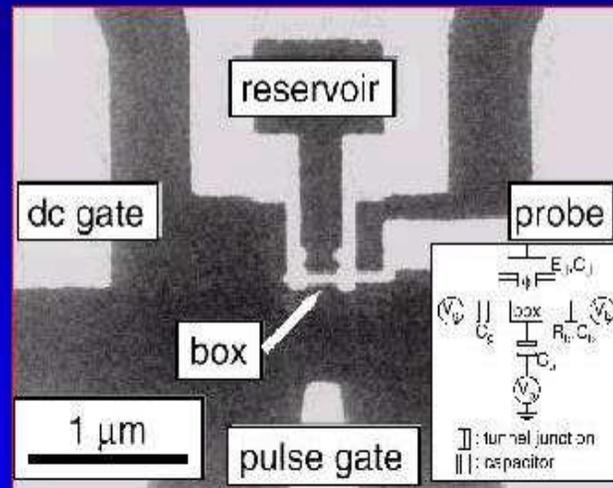

$T_2 > 0.3$  sec ; ~ 200 gates

# Solid State Spin QC?

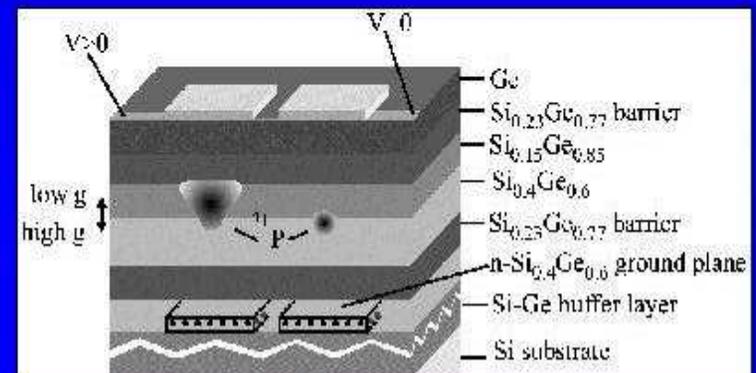

- Nuclear spins of  $^{31}\text{P}$  in Si  
(Kane, Nature 393, p133, 1998)

- Cooper pairs with Josephson Junctions

(Nakamura, Nature 398, p. 786, 1999)

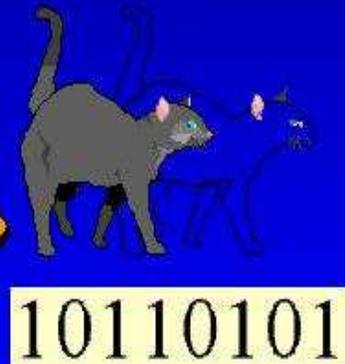

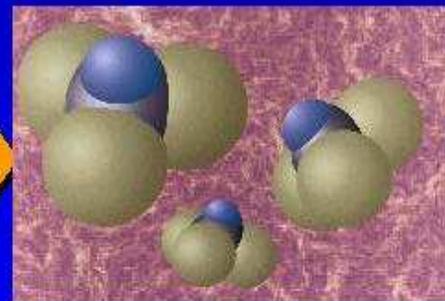

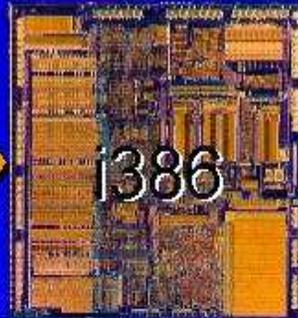

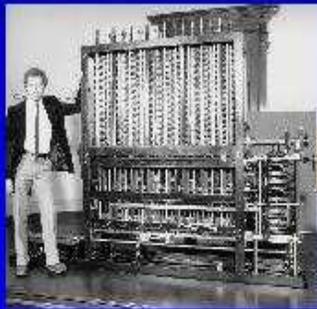

- Electron spins with SiGe FET's  
(Yablonovitch, quant-ph 9905096)

Status: Concept, No Prototypes

# Summary

- Quantum computation and quantum information:
  - New ways to view the physical world around us, in terms of algorithms and information processing
  - How do physical systems represent and process information?
