

Simultaneous Multi-threading Implementation in POWER5 -- IBM's Next Generation POWER Microprocessor

Ron Kalla, Balaram Sinharoy, Joel Tendler IBM Systems Group

© 2003 IBM Corporation

Outline

- Motivation
- Background
- Threading Fundamentals
- Enhanced SMT Implementation in POWER5
- Additional SMT Considerations
- Summary

Microprocessor Design Optimization Focus Areas

- Memory latency
 - Increased processor speeds make memory appear further away
 - Longer stalls possible
- Branch processing
 - Mispredict more costly as pipeline depth increases resulting in stalls and wasted power
 - Predication drives increased power and larger chip area
- Execution Unit Utilization
 - Currently 20-25% execution unit utilization common
- Simultaneous multi-threading (SMT) and POWER architecture address these areas

POWER4 --- Shipped in Systems December 2001

- Technology: 180nm lithography, Cu, SOI
 - POWER4+ shipping in 130nm today
- Dual processor core
- 8-way superscalar
 - Out of Order execution
 - > 2 Load / Store units
 - 2 Fixed Point units
 - 2 Floating Point units
 - Logical operations on Condition Register
 - Branch Execution unit
- > 200 instructions in flight
- Hardware instruction and data prefetch

POWER5 --- The Next Step

- Technology: 130nm lithography, Cu, SOI
- Dual processor core
- 8-way superscalar
- Simultaneous multithreaded (SMT) core
 - Up to 2 virtual processors per real processor
 - 24% area growth per core for SMT
 - Natural extension to POWER4 design

Multi-threading Evolution

Changes Going From ST to SMT Core

- SMT easily added to Superscalar Micro-architecture
 - Second Program Counter (PC) added to share I-fetch bandwidth
 - GPR/FPR rename mapper expanded to map second set of registers (High order address bit indicates thread)
 - Completion logic replicated to track two threads
 - Thread bit added to most address/tag buses

IBM

Resource Sizes

- Analysis done to optimize every micro-architectural resource size
 - GPR/FPR rename pool size
 - I-fetch buffers
 - Reservation Station
 - SLB/TLB/ERAT
 - I-cache/D-cache
- Many Workloads examined
- Associativity also examined

Number of GPR Renames

Results based on simulation of an online transaction processing application Vertical axis does not originate at 0

Resource Sharing

Global Completion Table Occupancy

Results based on simulation of an online transaction processing application

- Threads share many resources
 - Global Completion Table, BHT, TLB, . . .
- Higher performance realized when resources balanced across threads
 - Tendency to drift toward extremes accompanied by reduced performance
- Solution: Dynamically adjust resource utilization

Resource Sharing

Global Completion Table Occupancy

Thread Priority

- Instances when unbalanced execution desirable
 - No work for opposite thread
 - Thread waiting on lock
 - Software determined non uniform balance
 - Power management

• ...

- Solution: Control instruction decode rate
 - Software/hardware controls 8 priority levels for each thread

Dynamic Thread Switching

- Used if no task ready for second thread to run
- Allocates all machine resources to one thread
- Initiated by software
- Dormant thread wakes up on:
 - External interrupt
 - Decrementer interrupt
 - Special instruction from active thread

Single Thread Operation

- Advantageous for execution unit limited applications
 - Floating or fixed point intensive workloads
- Execution unit limited applications provide minimal performance leverage for SMT
 - Extra resources necessary for SMT provide higher performance benefit when dedicated to single thread
- Determined dynamically on a per processor basis

Matrix Multiply

Other SMT Considerations

- Power Management
 - SMT Increases execution unit utilization
 - Dynamic power management does not impact performance
- Debug tools / Lab bring-up
 - Instruction tracing
 - Hang detection
 - Forward progress monitor
- Performance Monitoring
- Serviceability

Summary

POWER5 SMT implementation is more than SMT

- Good ROI for silicon area: Performance gain > Area increase
- Resource sizes optimized
- Dynamic feedback enhances instruction throughput
- Software controlled priority exploits machine architecture
- Dynamic ST to/from SMT mode capability optimizes system resources
- SMT impacts pervasive throughout chip
- Operating in laboratory
 - AIX, Linux and OS/400 booted and running
