# Schedule

---

**1:30 - Project motivation and high level system design**

Amir Michael (manager, system engineering)

**2:30 - Storage design**

Eran Tal (hardware engineer)

**3:00 - Break**

**3:30 - Motherboard design**

Harry Li (hardware engineer)

**4:00 - Power supply design**

Pierluigi Sarti (technical lead, power)

**4:30 - Open source and challenges**

David Recordon (open source manager)

A photograph of a server room. The room is filled with rows of dark-colored server racks. A central aisle is marked with yellow and black diagonal caution tape. The ceiling is visible with various pipes and conduits. The lighting is bright, coming from overhead fixtures. The overall scene is a typical data center environment.

## Hacking Conventional Computing Infrastructure

We started a project at Facebook a little over a year ago with a pretty big goal: to build one of the most efficient computing infrastructures at the lowest possible cost. We decided to honor our hacker roots and challenge convention by custom designing and building our software, servers and data centers from the ground up - and then share these technologies as they evolve.

The result is a data center full of vanity free servers which is 38% more efficient and 24% less expensive to build and run than other state-of-the-art data centers.

By releasing Open Compute Project technologies as open hardware, our goal is to develop servers and data centers following the model traditionally associated with open source software projects. That's where you come in.
